INTRODUCTION

Microsoft is interested in venturing into the world of original movie content and has recently set up a new movie studio. However, as they don't have any prior experience in this field, they require guidance in selecting the right types of films to produce.

To address this issue, I will analyze data on the current box office trends and interpret the insights to advise Microsoft on the types of movies that are performing well and why. This will enable them to make informed decisions on what movies to create in their new studio.

OBJECTIVE

Objective:

To identify the types of films that are currently performing best at the box office and provide actionable insights for Microsoft to make informed decisions about the types of films they should create.

Steps to be undertaken:

Load all relevant data sets.

Examine the data to ensure it has been loaded correctly, checking the size, data types, and any missing values.

Clean the data by removing irrelevant columns or rows, renaming columns, handling missing values, and correcting any errors.

Merge the relevant data sets to create a master data set.

Use data analysis to explore the data, looking for trends, patterns, and relationships between variables.

Use data visualization to present the data in a clear and meaningful way.

Draw conclusions from the analysis and provide recommendations based on findings.

Communicate the findings and recommendations to the Microsoft team.

25%	120000	2012
50%	1400000	2014
75%	27900000	2016
max	936700000	2018

```
In [406]: # Examine the year 2010 for the top five trends.

bom_df_2010 = bom_df[(bom_df['year'] == 2010)]

#drop missing data

bom_df_2010 = bom_df_2010.dropna()
```

```
In [407]: # Examine domestic gross for 2010
bom_df_2010.describe().astype(int)
```

Out[407]:

	domestic_gross	year
count	308	308
mean	32963448	2010
std	60668552	0
min	800	2010
25%	280250	2010
50%	4000000	2010
75%	40400000	2010
max	415000000	2010

By calculating both the mean and median, we get a sense of the central tendency of the domestic gross box office distribution for films released in 2010. In this case the mean and median are close in value, suggesting that the distribution is roughly symmetrical, with no strong outliers.

```
Domestic 2010 gross box office mean 32963448.373376623 Domestic 2010 gross box office median 4000000.0
```

Examine another year to compare with 2010. Here I pick 2018 to see difference over greater time period.

```
In [409]: bom_df_2018 = bom_df[(bom_df['year'] == 2018)]
bom_df_2018.dropna()
```

173 rows × 5 columns

Here we are getting the statistical summary of the numerical columns in the dataframe bom_df_2018, and then converting the results to integer type. Thereafter we generate a summation of the data of the numbes in columns.

```
In [410]: bom_df_2018.describe().astype(int)
```

Out[410]:

	domestic_gross	year
count	308	308
mean	36010421	2018
std	85733961	0
min	1300	2018
25%	175250	2018
50%	2700000	2018
75%	35950000	2018
max	700100000	2018

Identify year 2018 domestic gross mean and median. Compare to 2010 mean and median. This code helps to provide useful summary statistics for the domestic_gross column and help give an idea of the typical box office performance of movies released in 2018. The results therefore suggests that there were some movies that performed exceptionally well and brought up the mean, while most movies had lower domestic gross earnings.

Domestic 2018 gross box office mean 36010421.75 Domestic 2018 gross box office median 2700000.0

Data Analysis

Here I would like to narrow my focus on the questions of what is the best performing movies, and look at the data related to production costs and identify relationship to domestic revenue and worldwide revenue. Consider whether the median cost to produce a movies has changed over times. Identify key movie attributes that may lead to box office success.

Out[469]:

SUMMARY DATA ANALYSIS

In summary, the most popular months for releasing a top 50 film are November, December, June, and July. The median runtime for these films is 114 minutes with a maximum runtime of 180 minutes. Action, adventure, and western films are common in the top 50. There is not much difference in ratings between top 50 films and the overall dataset.

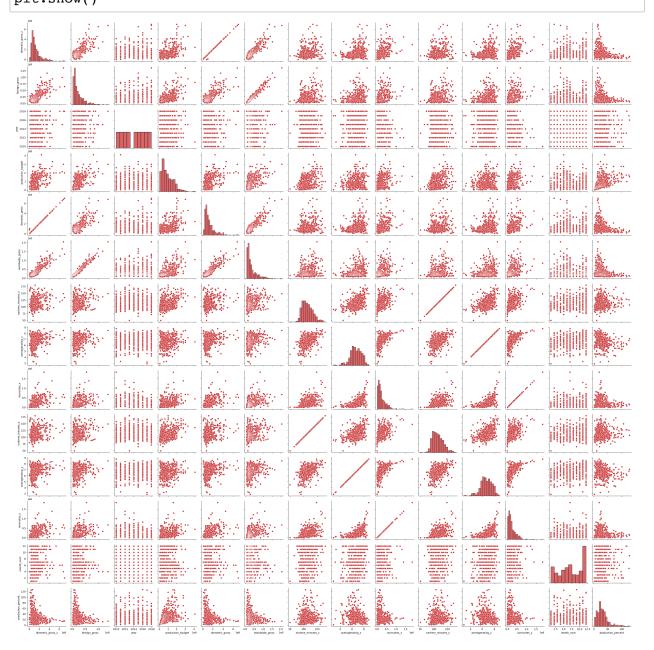

The new dataframe, which includes the top 50 films of each year, shows that the median cost for these films is USD 75 million, which is significantly higher than the original dataframe's median cost of USD 35 million. Additionally, the worldwide revenue median for the top 50 films is USD 240 million compared to all films at under USD 90 million. The median payment for a top 50 film is 26% of gross revenue, but the range can be as high as 17-39%. The majority of top 50 films range between 99-127 minutes and are often action and adventure films. The cost of a film does not necessarily affect the ratings.

However, the dataset only considers films from 2010 to 2018 and does not account for any changes to the movie industry. Therefore, future analyses may need to consider a more comprehensive understanding of movie attributes and revenue.

Conclusions and Recommendation

In order to help Microsoft break into the movie business, this report merged three datasets to analyze the top 50 films from each year, 2010 to 2018. The analysis focused on production costs, revenue ranges, and factors that impact a film's success. The report recommends that Microsoft set aside a budget of at least USD 75 million per film to compete with other top films. Although Microsoft could start with lower budgets, it is important to have a cushion of funds available. Microsoft may have to spend more initially to establish relationships with directors, actors, distribution networks, and marketing structures. To expand returns on investment, worldwide releases are recommended. The report suggests developing three movie ideas to spread risk, although initial investments may be higher. A film should be released in May or June, which marks the beginning of the summer movie season. A runtime between 99 to 127 minutes is recommended, with longer runtimes for specific genres.
